

Topic 5 — Knowledge Integration Assessment

Project: AI Job Application Assistant

Knowledge File: AI_Job_Application_Assistant_Knowledge_Guide.md

Repository: ai-job-application-assistant-knowledge-integration

Loom: <https://www.loom.com/share/c146a88f091640bc932602bee5614938>

1. Assessment Objective

This assessment demonstrates the integration of a dedicated Knowledge Guide into the AI Job Application Assistant. The GPT was configured to prioritize the uploaded Knowledge file for covered topics, avoid unsupported claims, reference relevant sections when practical, and handle unsupported or misleading questions safely.

2. Knowledge Integration

The Knowledge file contains the approved application workflow, job-description analysis standards, resume-tailoring standards, skill-match definitions, source and evidence rules, unsupported-question handling, misleading-question handling, and an application-readiness checklist.

3. GPT Configuration

The Custom GPT instructions were updated with Knowledge Rules covering: Knowledge-file priority, anti-hallucination behavior, source-reference rules, unsupported-question handling, and misleading-question correction. Web Search was disabled during the final validation of the uncovered-question test so that unsupported information would not be supplied from external sources.

4. Validation Tests

Test	Category	Result
1	Fully covered — skill-match classifications	PASS
2	Fully covered — invented metrics/achievements	PASS
3	Fully covered — requirement outside Knowledge Guide	PASS
4	Partially covered — education section	PASS
5	Uncovered — 2026 software-engineer salary	PASS
6	Misleading — universal ATS-score claim	PASS

5. Key Validation Findings

- Covered questions were answered using the Knowledge Guide and relevant source sections were referenced.
- The GPT refused to invent metrics, achievements, qualifications, or other unsupported application information.
- Partially covered questions were handled without creating a universal rule that was not present in the Knowledge Guide.
- Uncovered salary information was not supplied after Web Search was disabled for the final validation.
- The misleading ATS-score premise was rejected and corrected using the actual Knowledge Guide content.

6. Deliverables

- AI_Job_Application_Assistant_Knowledge_Guide.md
- test_qa_results.md
- Updated AI Job Application Assistant Custom GPT

- Loom demonstration video
- GitHub repository

7. Challenge, Resolution & Assumptions

Challenge: An uncovered question initially triggered external web-based answers because Web Search was enabled.

Resolution: Web Search was disabled for the assessment validation, and the uncovered-question test was repeated successfully. The final GPT stated that the information was not covered by the Knowledge Guide instead of providing unsupported figures.

Assumptions: The uploaded Knowledge Guide is authoritative for the assistant's application-support process and definitions. For a specific application, the user's provided job description and resume remain the source of truth for that application's facts.

8. Final Result

6/6 validation tests passed. The final implementation demonstrates Knowledge integration, source-aware responses, anti-hallucination controls, unsupported-question handling, and misleading-premise correction.
